Extension For Magento 2

Quick View allows you to quickly view and add products to the shopping cart without going to the product page.

With the extension of Magento Quick View, you can simplify the process of browsing the catalog and allow customers to instantly view information about the product directly to the category page. With convenient pop-up window containing all the necessary information about the product, customers can take purchase decisions much more quickly and easily add items to the shopping cart directly from the popup.

Main functions:
- quick view of the goods;
- It operates without using iframe;
- All functions within the pop-up work;
- It has integrated cache through javascript;
- includes navigation buttons to the next and previous product
- supports multi-page navigation.
- It works well with our Infinity Scroll module
- works perfectly with FPC

Installation:

- Copy the folder with the module at the root of your site;
- run the following command:
        php bin/magento setup:upgrade
        php bin/magento setup:di:compile
        php bin/magento setup:static-content:deploy
        php bin/magento cache:clean
- after they are completed, you should see in the app/etc/config.php this module.

You must add in all the extra catalog_category_view.xml file js and css, which are used on the product page. For example, in app/code/Konstanchuk/QuickView/view/frontend/layout/catalog_category_view.xml already adding line `<css src="mage/gallery/gallery.css"/>`

Place the highlighted code quick view button in the file vendor/magento/module-catalog/view/frontend/templates/product/list.phtml. To do this, you must override the file according to the Magento 2 coding standard

```php
<?php // Product Image ?>
<a href="<?php /* @escapeNotVerified */ echo $_product->getProductUrl() ?>" class="product photo product-item-photo" tabindex="-1">
   <?php echo $productImage->toHtml(); ?>
</a>
<?php
```

```php
/** @var \Konstanchuk\QuickView\Block\QuickViewBtn $quickViewBtn */
$quickViewBtn = $block->getChildBlock('quick_view_btn');
if ($quickViewBtn) {
  echo $quickViewBtn->setProduct($_product)->toHtml();
}
?>
<div class="product details product-item-details">
  <?php
    $_productNameStripped = $block->stripTags($_product->getName(), null, true);
  ?>
```

Go to admin-> stores-> configuration-> catalog->catalog->quick view and turn on the module. Also here you can specify additional settings.

If you did everything correctly, then in the directories, you will have a quick view button, which will open the product page in the pop-up window. You should also include the operation of all functions within the window via AJAX. For example, the function of adding product to the cart using AJAX supplied standard Magento 2.

Note: The extension can override the files that you already use. Make sure that there are no conflicts with your modules before using this module. The module has been tested on Magento 2.1 with Sample Data.
